ASSESSMENT TOOL 2 – CASE STUDY

Course Code:	CSA06	Course Title:	Design and Analysis of Algorithms
CO Assessed:	CO3: Articulation (BL4, BL5)	Assessment:	Assessment Tool 2 – Case Study
Weightage:	20% of CIA	Total Marks:	100
CO3 Statement:	Design Divide and Conquer algorithms for Merge Sort, Quick Sort, Binary Search and Matrix Multiplication		
Student Name:	Sree B	Reg. No.:	192524023
Section / Batch:	B. Tech AI and DS	Date:	11/08/2026

Instructions to Students

- Answer the following question. Total Marks: 100.
- Carefully analyze the given case study questions.
- Explain in detail with sample code if needed.
- Clearly identify all key issues, provide an in-depth analysis, and propose innovative, feasible solutions with strong justification.

Question Type	Focus Area	Questions
Case Study	Focus on Design Divide and Conquer algorithms: Merge Sort, Quick Sort, Binary Search and Matrix Multiplication	Q1

SECTION A – CASE STUDY

1.A retail system must frequently sort inventory data based on price and demand. Analyze the use of Merge Sort and Quick Sort in this context. Identify issues such as memory usage, speed, and data size. Apply divide and conquer principles to compare both algorithms. Analyze their performance and design a solution, justifying the most suitable approach.

Code of Conduct

I Sree B(192524023) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: Sree B

RUBRICS FOR CALCULATION

Case Study					
Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Understanding of Case	25%	Thorough understanding; clearly identifies all key issues	Good understanding with most issues identified	Basic understanding; some issues missed	Poor understanding; problem not identified correctly
Application of Concepts	25%	Effectively applies relevant concepts to analyze the case deeply	Applies appropriate concepts with minor gaps	Limited application of concepts	Fails to apply relevant concepts
Analysis	20%	In-depth analysis with strong reasoning and insights	Good analysis with logical reasoning	Basic analysis with limited depth	Weak or no analysis; lacks reasoning
Solution Design	20%	Innovative, feasible solutions with strong justification	Logical solutions with adequate justification	Basic solutions with weak justification	Incorrect or no solution provided
Clarity	10%	Clear, well-structured, and easy to understand	Organized and understandable presentation	Limited clarity and structure	Poor clarity; difficult to understand

Marks Evaluation:

Criteria	Wt.	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Understanding of Case	25%				
Application of Concepts	25%				
Analysis	20%				
Solution Design	20%				
Clarity	10%				
Total Marks (100):

Q1
Retail Inventory Sorting (Merge vs Quick Sort)
100 marks
1/1 answered

Q1 Retail Inventory Sorting (Merge vs Quick Sort)

100 marks

A retail system must frequently sort inventory data based on price and demand. Analyze the use of Merge Sort and Quick Sort in this context. Identify issues such as memory usage, speed, and data size. Apply divide and conquer principles to compare both algorithms. Analyze their performance and design a solution, justifying the most suitable approach.

Your Code

```
1 import random
2 import time
3 import sys
4
5 def merge_sort(arr, key=lambda x: x):
6     if len(arr) <= 1:
7         return arr
8
9     mid = len(arr) // 2
10    left = merge_sort(arr[:mid], key)
11    right = merge_sort(arr[mid:], key)
12
13    return merge(left, right, key)
14
15
16 def merge(left, right, key):
17     result = []
18     i = j = 0
19
20     while i < len(left) and j < len(right):
21         if key(left[i]) <= key(right[j]):
22             result.append(left[i])
23             i += 1
24         else:
25             result.append(right[j])
26             j += 1
27
28     result.extend(left[i:])
29     result.extend(right[j:])
30     return result
31
32
33 def quick_sort(arr, key=lambda x: x, low=0, high=None):
34     if high is None:
35         high = len(arr) - 1
36
37     if low < high:
38         pi = partition(arr, key, low, high)
39         quick_sort(arr, key, low, pi - 1)
40         quick_sort(arr, key, pi + 1, high)
41
42     return arr
43
44
45 def partition(arr, key, low, high):
46     mid = (low + high) // 2
47     candidates = [low, mid, high]
```

Input

Output

```
Enter an input size
100
----- Testing with 100 inventory items -----
```
